DETAILED ACTION

Specification

The disclosure is objected to because of the following informalities:
 complete spelling for acronyms should be used the first time in the specification.
 For example, complete spelling for acronyms MIDI, OMAP, ASIC...

Appropriate correction is required.

Claim Objections

2. Claims 1, 4, 6, and 7 are objected to because of the following informalities: complete spelling for acronyms should be used the first time in each independent claim. For example, claim 1 line 1 "...implementing MIDI synthesis..." should be --... implementing Musical Instrument Digital Interface (MIDI) synthesis...-.. Appropriate correction is required.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kawashima (U.S. Patent 6,549,767) in view of Arnold et al. (U.S. Patent 5,908,997).

Application/Control Number: 09/909,010

Art Unit: 2642

Regarding claims 1, 4, and 6, Kawashima teaches a method of implementing MIDI synthesis comprising the steps of: providing a wireless handset (portable telephone 1) having dual processor a general purpose processor CPU 10 and a digital signal processor (Fig. 2, tone generator 33 employs a DSP and col. 22, lines 56-58), musical data stored in the RAM 11 or flash memory (col. 21, lines 42-44), a digital to analog converter DAC 35 and DSP peripherals to drive the DAC; time stamping the MIDI commands format to render audio signals to the DAC (col. 6, lines 60-65).

Kawashima does not teach interrogating the flash memory via the GPP to open a MIDI bit stream and determine sample sets to be loaded into a DSP memory associated with the DSP, loading via the GPPP a DSP code associated with the sample sets into the DSP memory, initializing a sample set memory and signaling the DSP to start running a DSP; parsing the MIDI bit stream into synthesis packets and transferring the packets to the DSP via GPP.

Arnold et al. teach interrogating the flash memory via the GPP to open a MIDI bit stream and determine sample sets to be loaded into a DSP memory associated with the DSP, loading via the GPP a DSP code associated with the sample sets into the DSP memory (col. 11, lines 1-17); initializing a sample set memory (col. 11, line 66 through col. 12, line 4); parsing the MIDI bit stream into synthesis packets (col. 11, lines 29-30), and then obviously transferring the packets to the DSP via GPP.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the features mentioned above, as taught by

Application/Control Number: 09/909,010

Art Unit: 2642

Arnold, in Kawashima's system in order to have a wireless handsets that would utilize flash memory to optimize the use of DSP memory by only loading required sample sets from flash, optimize space and minimize costs. These are common motivations in any system and that Arnold does not change the operation of Kawashima.

Regarding claims 2, 3 and 5, Kawashima does not explicitly teach closing the MIDI bit stream when it has been exhausted; causing the DSP to stop synthesizing the MIDI commands; and de-allocating the sample set memory. As mentioned above, it would be necessary to close the MIDI bit stream, stop synthesizing the MIDI commands and de-allocating the sample set memory in order minimize costs and optimize space.

Claims 7 and 9 are rejected for the same reasons as discussed above with respect to claim 1. Furthermore, Kawashima teaches data storing means RAM 11 and Arnold et al. teach data storing means RAM memory 160; Kawashima further teaches first data processing means general purpose processor CPU 10 for synthesizing audio signals; data converting means a digital to analog converter DAC 35; and a second data processing means for reading and parsing the MIDI files a digital signal processor (Fig. 2, tone generator 33 employs a DSP and col. 22, lines 56-58).

Regarding claim 8, Arnold et al. teach the data storing means comprises a flash memory (col. 10, lines 56-57).

Regarding claim 10, Arnold et al. teach the first data processing means is word addressable (col. 12, line 51 – CPU 128 MB) and the second data processing means is byte addressable (col. 12, lines 55-57).

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Quynh H. Nguyen whose telephone number is 703-305-5451. The examiner can normally be reached on Monday - Thursday from 6:30 A.M. to 5:00 P.M.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ahmad Matar, can be reached on (703) 305-4731. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-4700.
